CLUVAIRE

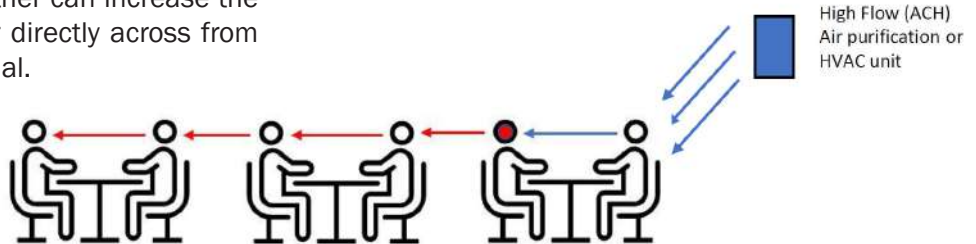

Clean UVC Air Purifier Hybrid Light Fixture Units

PROBLEM: Cross Flow Air Transmission

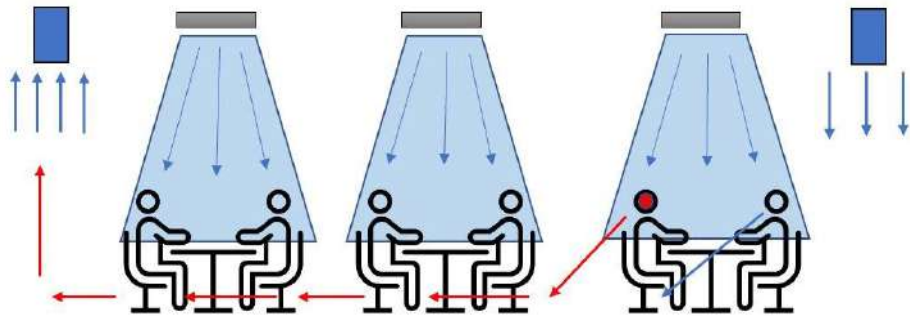

Moving air from one side of the room to the other can increase the infectious airborne transmission by pulling air directly across from an infected individual to an uninfected individual.

Cross flow air transmission infections can occur even if the source of the airflow is from a sanitized air system because the contamination source is in the room.

SOLUTION: The UVC Air Panel

In-room multiple point air sanitization is more important than ACH UVC Air Sanitizers positioned above occupied areas. UVC Air Panels create positive pressure sanitized air zones that can reduce airborne person to person transmission.

BENEFITS: Low Cost and Scalable

- Works with existing HVAC systems
- Easy to install
- Uses existing light fixture locations and wiring
- Low installation cost
- Number of units does not change the room lighting level
- Low annual maintenance and parts cost
